HX8282-A11 1536CH TFT LCD Source Driver with LVDS TCON

Revision History

Version	Date	Description of changes					
01	2013/11/13	New setup.					
	2015/05/13	All pages					
		Remove 'preliminary' wording.					
		Page 9					
		2. Update Figure 3.1 HX8282-A11 function block diagram,					
		add SCL, SDA and CSB signal.					
		Page 14 3. Undate application power circuit: change I. 10uH to industance					
		3. Update application power circuit; change L, 10µH to inductance					
		value: Depend on panel loading and operation voltage, default					
		10μH.					
		Page 15 4. Update HSD pin description, add default setting.					
		Page 17 5. Update F_CtrlR/CtrlL pin description, update gate driver pin					
		setting.					
		Page 19					
		Page 19 6. Update wiring resistance.					
		(1)Add VDD LVDS, AGNDH, AVDDL < 5Ω.					
		(2)Modify CLK→ DCLK, CLKN →NINC.					
		(3)Add COM1 IN $< 5\Omega$.					
		(4)Modify MASL_OC → MASLOC.					
		(5)Add DCLKPOL, DUAL < 100Ω.					
		Page 35					
		7. Remove GRB pulse width condition

HX8282-A11 1536CH TFT LCD Source Driver with LVDS TCON

Version 01

May, 2015

1. General Description

HX8282-A11 is a 1536-channel outputs source driver with LVDS, TCON, and 3-wire Serial Port Interface. This chip integrates 1536ch dual gate mode source driver with LVDS and parallel RGB input interface. The TCON generates the 1024x600, 1024x768, 800x600, 800x480 and 960x540 resolutions and provides horizontal and vertical control timing to source driver and gate driver.

It also supports dithering feature, apply source driver with 6-bit DAC to perform 8-bit resolution 256 gray scales. The source driver receives 6-bit by 3 dots of digital display data per clock from TCON and generates corresponding 64-level gray scale voltage output. Since the output circuit of this source driver incorporates an operational amplifier with low power dissipation, and performs wide voltage supply range and small output deviation. Therefore, a high quality display with less crosstalk can be achieved.

2. Features

TCON

- Support display resolution 1024RGBx600, 1024RGBx768, 800RGBx600, 800RGBx480 and 960RGBx540.
- Support LVDS/TTL interface
- Support single or dual gate function
- Support cascade function with bidirectional shift control (CMOS signal)
- Internal dithering 8-bit data to 6-bit data for Source Driver Circuit (6-bit DAC + 2-bit FRC or HFRC)
- Built-In CABC function
- Built-In AUTO pattern
- Only support stripe types of panel group
- Operation frequency: 71MHz max
- Provide source and gate drivers control timing
- Provide flip and mirror scan control
- Operation Voltage Level 2.3V to 3.6V

Source Driver

- 1536-channels outputs source driver for TFT LCD panel
- Embedded gamma table for special custom request
- V1~V14 for adjusting gamma correction
- Dynamic output range: 0.1 to AVDD-0.1V
- Voltage deviation of outputs: ±20mV
- Dot inversion and 1+2 Dot inversion driving scheme
- Right and left shift capability
- LCD power: 6.5V to 13.5V

Power

- Built-In PWM controller for AVDD, VGH / VGL, and VCOM buffer
- Support half voltage source driver

Application

Special designed for low cost UMPC application

Others

COG package

5. The BIST Pattern For Aging Mode Test

5.1 The BIST pattern for aging mode test

HX8282-A11 supports BIST pattern for aging mode test automatically. When external BIST pin set to "H" level, then HX8282-A11 will leave normal operation mode and starts to generate the BIST pattern to LCD panel without external clock signal. The BIST pattern is illustrated as below:

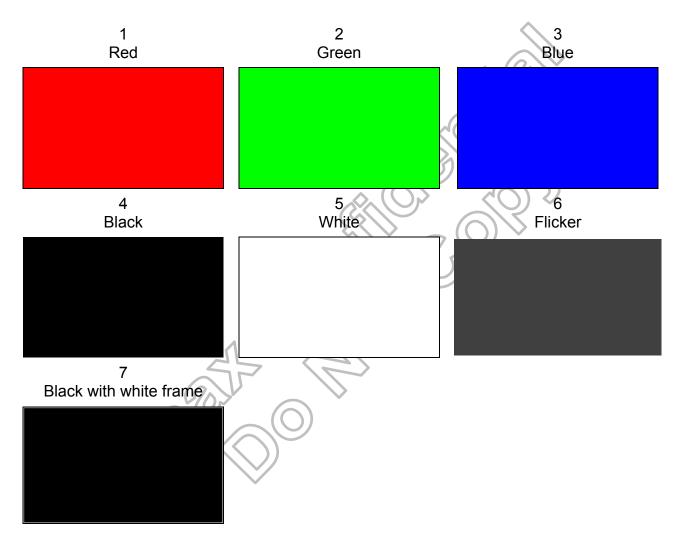

Table 5.1: BIST mode pattern

6. Gamma Adjustment Function

6.1 Gamma table

The output voltage is determined by the 6-bit digital input data and the 6 γ correction reference voltage.

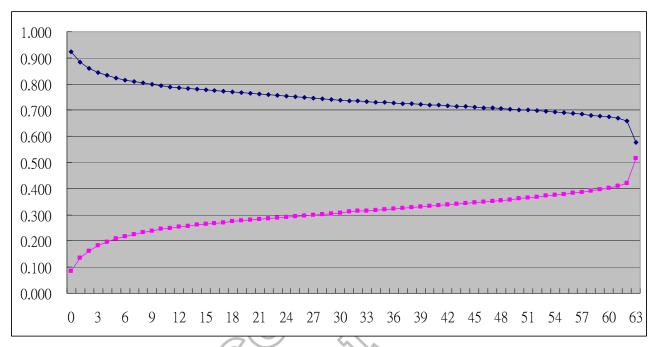

Figure 6.1: Gamma curve

The actual output voltages for all 64 input data at positive and negative polarity is as shown on the following page.

6.2 Positive polarity and negative polarity

AVDD=9.6V

V1	V2	V3	V4	V5	V6	V7	V8	V9	V10	V11	V12	V13	V14	Unit

Table 6.2: Negative polarity

7. 3-wire Serial Peripheral Interface (SPI)

7.1 SPI format

The HX8282-A11 supports the 3-pin serial peripheral interface (**SPI**) to set internal register. The data is written to the register of assigned address when "End of transfer" is detected after the 16th SCL rising cycles.

Data is not accepted if there are less or more than 16 cycles for one transaction. Only when SCL is input 16 times and CSB is in the "Low" period simultaneously, SDA is accepted. It needs DCLK input for SDA setting.

The first 6 bits (A5 to A0) specify the address of the register. The 7th bit means Read/Write command. "0" is WRITE. "1" is READ. The 8th bit means "Don't care or Hi-Z". It is "Don't care" in write format, and "Hi-Z" in read format. And the last 8 bits are for Data setting (D7 to D0). The address and data are transferred from the MSB to LSB sequentially. And next cycle is turn-round cycle.

Setting of all the SPI will take effect at the coming falling edge of VSD except GRB and STB bit.

Table 7.5: Function control 2 register

8. Power On/Off Sequence

To prevent the device damage from latch up, the power on/off sequence shown below must be followed.

Power on: VDD, GND → AVDD, AGND → V1 to V14 Power off: V1 to V14 → AVDD, AGND→ VDD, GND

8.1 Power on/off control

HX8282-A01 has a power on/off sequence control function. In order to prevent IC from power on reset fail, the rising time (T_{POR}) of the digital power supply VDD should be maintained within the given specifications. Please refer to "AC Characteristics" for more detail on timing.

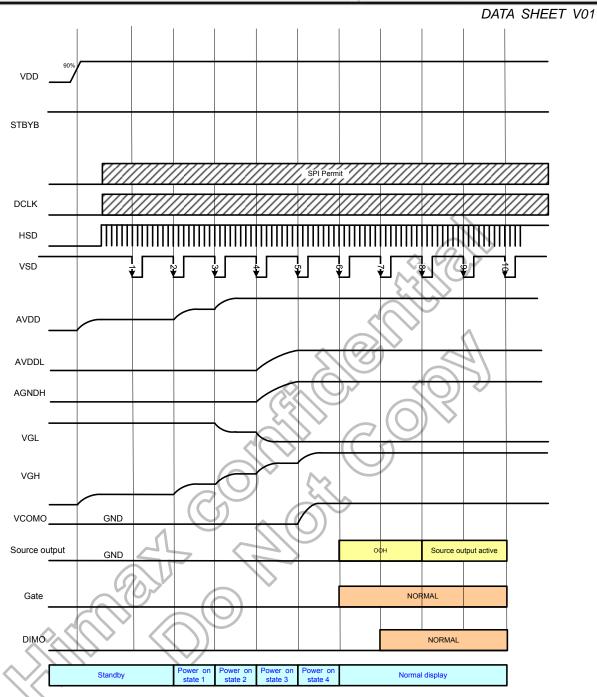

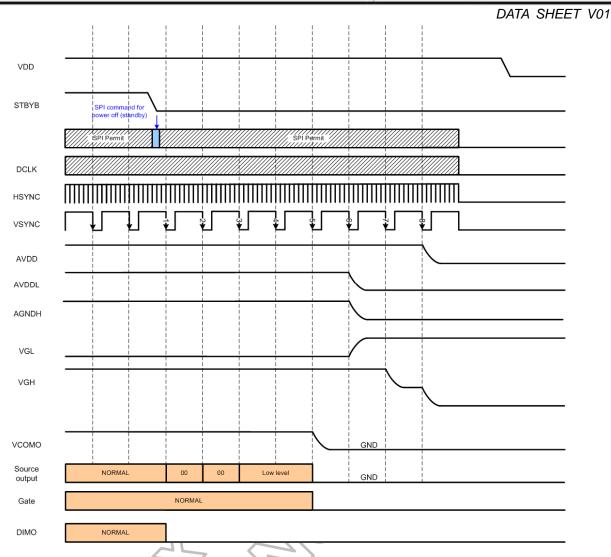

Figure 8.1: Power on timing sequence

Note: (1) Low level=3FH, when NBW=L. (Normally white) (2) Low level=00H, when NBW=H. (Normally black)
